Super Family: Platysceliodes	Family: Parascelidae																									
Genus: <i>Thyropus</i>	Species : <i>sphaeroma</i>																									
<p>Geographical Location: This species widespread in the tropical zone of all oceans. It is known from the Atlantic (between 47° N and 36° S, including the equatorial zone), India (Arabian Sea), and Pacific (Kuroshio, Hawaiian Islands, eastern part from 40° N to 30° S, and equatorial zone) oceans. It inhabits the upper 200 m layer.</p> <table border="0"> <tr> <td>Latitude:</td> <td>Place:</td> </tr> <tr> <td>Longitude:</td> <td>State:</td> </tr> </table>			Latitude:	Place:	Longitude:	State:

DATA ENTRY FORM: Form -2 (Fish/ Shell fish/ Others ) Ref. No.:  
(Please answer only relevant fields; add additional fields if you require)  
Form- 1 Ref. No.:

#### IMPORTANCE

Landing statistics (t/y): from                      to                      Place:                      Ref. No.:  
Main source of landing: Yes/ No                      Coast: east/ west  
Importance to fisheries:  
Main catching method:  
Used for aquaculture: yes/ never/ rarely  
Used as bait: yes/no/ occasionally  
Aquarium fish: yes/ no/ rarely  
Game fish: yes/ no  
Dangerous fish: poisonous/ harmful/ harmless  
Bioactivity: locally known/ reported/ not known                      Details:  
Period of availability: Throughout the year – yes/ no                      If no, months:

#### SALIENT FEATURES:

##### Morphological:

Diagnostic characteristics: Antennae I in males with a four-segmented flagellum; the 1st segment is the largest, notably curved forward, and distally so narrows that its apical margin is equal in width to the base of the 2<sup>nd</sup> segment. Antennae II in males with a short, uncurved basal segment, with slightly bulged margins, its width 1/3 its length, the antennae are long and thin and folded zigzag five times; the 2<sup>nd</sup> segment is approximately four times longer than the basal; the 4<sup>th</sup> segment is much shorter than the 3<sup>rd</sup> and almost twice as long as the 5<sup>th</sup>.

Pereopods I are equal to or somewhat shorter than pereopods II; the 2<sup>nd</sup> segment is equal to the 4<sup>th</sup> and 5<sup>th</sup> together; the 5<sup>th</sup> segment is much shorter and narrower than the 4<sup>th</sup>, and the 6<sup>th</sup> 2/3 the length of the 5<sup>th</sup>; the claw is short. The 5<sup>th</sup> segment of pereopods II is shorter than in pereopods I and the 6<sup>th</sup> segment longer. Coxal plate V has a long spiniform process on the inner surface; the 2<sup>nd</sup> segment is oval and 1.6-1.7 times longer than wide; the distal segments together are somewhat shorter or longer than the 2<sup>nd</sup> segment; the 5<sup>th</sup> segment is linear and twice longer than the 4<sup>th</sup>; the 6<sup>th</sup> segment is shorter and narrower than the 5<sup>th</sup> but 1.5 times longer than the 4<sup>th</sup>. The 2<sup>nd</sup> segment of pereopods VI is almost twice longer than in pereopods V, broad, markedly narrowed proximally and distally, its anterior margin notably concave medially, the posterior margin bulged in the proximal half, and a small oval fissure occurs close to the base of the segment; the 3<sup>rd</sup>-7<sup>th</sup> segments together are 1/4 the length of the 2<sup>nd</sup>; the 4<sup>th</sup> segment is straight and linear and without an anterior distal process; the 5<sup>th</sup> segment is straight, almost linear, and 2/3 the 4<sup>th</sup> in length and narrower than it; the 6<sup>th</sup> segment is 1/2 the length of the 4<sup>th</sup>; the claw is approximately 1/3 the length of the 6<sup>th</sup> segment. The 2<sup>nd</sup> segment of pereopods VIII is 2.5 times longer than wide. The anterior margin concave, and the posterior convex; the number and length of the distal segments are highly variable but individuals with two short distal segments encountered more often.

The basipodite of uropods I is distally broadened and its anterior margin denticulate almost throughout its length; the exopodite is lanceolate and equal to the

basipodite in length; the endopodite is broadly lanceolate,  $1/3$  the exopodite in length and twice as broad, and its tip does not reach the tip of the telson. The basipodite of uropods II is distally broadened; the rami are lanceolate; the exopodite is 1.5 times longer than the endopodite. The basipodite of uropods III is almost equal in length and width; the rami are broadly lanceolate; the endopodite is almost 2.5 times longer and also broader than the exopodite, its tip reaching somewhat beyond the tip of the telson. The last urosomite has slightly bulged lateral margins and its maximum width is almost twice its length. The telson is hemispherical, its length half its width at the base.

Sex attributes:

Dimorphic

Male: 1<sup>st</sup> antenna well developed, female: 1<sup>st</sup> antenna reduced.
